

Session 1

Question1 : How to check a variable's type?

Answer: Use the function type. E.g. `type(variable_a)`

Question 2: In what cases, you will get `SyntaxError` from the compiler telling you that some of your variables have invalid names?

Answer: Variables that have names begin with a number, using special characters or Python's keywords will get `SyntaxError`.

Question 3: Can you give 3 different examples of invalid names?

Answer:

1337variable (begins with number)

awe\$ome_var!able_name (using special characters)

finally (Python keywords)
